

WingsCODE

Guardrailed RAG Knowledge Base

AI Knowledge Assistant • Customer Support Reference

Version 1.0 • 2026

KNOWLEDGE RETRIEVAL • GROUNDED RESPONSES • GUARDRAILS

Purpose

This document is the approved knowledge source for the WingsCODE Knowledge Assistant.

The assistant is designed to answer questions using approved knowledge resources through Retrieval-Augmented Generation (RAG).

The assistant should provide reliable answers based on the information contained in this document and should avoid unsupported claims.

Document Details

DOCUMENT

WingsCODE Guardrailed RAG Knowledge Base

VERSION

1.0 (2026)

INTENDED USE

Knowledge source for the WingsCODE Knowledge Assistant in a Botpress Knowledge Base

ASSIGNMENT

AI & Workflow Automation — AI Chatbot Developer Internship, Task 3: Knowledge Base Integration (RAG)

1 About WingsCODE

WingsCODE is a technology-focused project brand that develops software, AI assistants, web applications, and workflow automation solutions.

The brand focuses on practical digital products and technology projects, including web development, conversational AI, AI-powered knowledge systems, workflow automation, and machine-learning applications.

This document represents the approved information available to the WingsCODE Knowledge Assistant for this demonstration.

2 Core Services

SERVICE	DESCRIPTION
Web Development	WingsCODE develops responsive websites and web applications for portfolios, businesses, and custom digital projects.
AI Chatbot Development	WingsCODE develops conversational assistants for customer support, information retrieval, and guided user interactions.
AI Workflow Automation	WingsCODE creates automated workflows that connect applications and business processes to reduce repetitive manual work.
Knowledge-Based AI	WingsCODE can develop AI assistants that retrieve information from approved documents and use that information to provide grounded responses.

3 Project Development Process

STEP 1

Requirements

Understand the project's goals, required features, inputs, outputs, and constraints.

STEP 2

Planning

Define the architecture, user flow, data sources, and implementation approach.

STEP 3

Design & Development

Build the interface, application logic, AI behavior, integrations, and supporting components.

STEP 4

Testing

Test normal use cases, unexpected inputs, edge cases, and fallback behavior.

STEP 5

Refinement

Improve usability, response quality, reliability, and overall presentation.

STEP 6

Deployment

Prepare the completed project for demonstration or production use where appropriate.

4 RAG — Retrieval-Augmented Generation

Retrieval-Augmented Generation (RAG) combines information retrieval with language-model generation.

For this WingsCODE Knowledge Assistant, the system retrieves relevant information from an approved knowledge source before generating an answer.

The purpose is to ground responses in documented information instead of allowing the assistant to freely invent company-specific facts.

RAG Principle: The assistant should prioritize information retrieved from its approved knowledge resources when answering questions about WingsCODE.

5 Guardrail Policy

Guardrailed Q&A Policy

- 1 Use the connected Knowledge Base as the **primary source** for factual answers about WingsCODE.
- 2 **Do not invent** prices, policies, clients, employees, dates, guarantees, or other unsupported information.
- 3 If requested information is not present in the Knowledge Base, **explicitly state that the information is unavailable**.
- 4 Do not present outside knowledge as verified WingsCODE information.
- 5 Keep responses clear, concise, professional, and relevant.
- 6 When the Knowledge Base does not provide sufficient information to answer a question, the assistant should **prefer transparency over speculation**.

CORRECT BEHAVIOR

USER "What is the price of an AI chatbot?"

ASSISTANT *"I don't have that information in my current knowledge base."*

This behavior is intentional. It demonstrates the Knowledge Assistant's hallucination-prevention guardrail: because pricing is not documented in the Knowledge Base, the Knowledge Assistant states that the information is unavailable instead of inventing an answer.

6 Information Boundaries

INFORMATION CATEGORY	AVAILABILITY
Exact service prices	Not documented
Discounts and promotional offers	Not documented
Refund policies	Not documented
Employee or staff information	Not documented
Customer personal information	Not documented
Guaranteed project completion dates	Not documented
Specific client names	Not documented
Private company information	Not documented

The absence of this information is intentional. The Knowledge Assistant must not fabricate answers for information that is outside the approved knowledge source.

7 Frequently Asked Questions

QUESTION	KNOWLEDGE-BASED ANSWER
Q1. What is WingsCODE?	WingsCODE is a technology-focused project brand that develops software, AI assistants, web applications, and workflow automation solutions.
Q2. What services does WingsCODE provide?	The documented services are web development, AI chatbot development, AI workflow automation, and knowledge-based AI solutions.
Q3. Does WingsCODE provide AI chatbot development?	Yes. AI chatbot development is one of the documented WingsCODE services.
Q4. What is RAG?	RAG stands for Retrieval-Augmented Generation. It retrieves relevant information from an approved knowledge source and uses that information to help generate a grounded response.
Q5. Why use a knowledge base with an AI assistant?	A Knowledge Base provides approved information that the assistant can retrieve when answering questions, helping keep responses aligned with the supplied source.
Q6. What is the typical WingsCODE project process?	The documented process is requirements, planning, design and development, testing, refinement, and deployment.
Q7. What is the price of an AI chatbot?	Pricing information is not included in the current Knowledge Base.
Q8. Who are WingsCODE's clients?	Specific client information is not included in the current Knowledge Base.

8 RAG & Guardrail Testing Plan

The Knowledge Assistant must be tested with both supported questions and guardrail questions.

TYPE A

Supported Questions

Questions whose answers exist inside the Knowledge Base.

TYPE B

Guardrail Questions

Questions whose answers do **not** exist inside the Knowledge Base.

TEST TYPE	QUESTION	EXPECTED BEHAVIOR
SUPPORTED	What services does WingsCODE provide?	Answer using the Knowledge Base.
SUPPORTED	What is RAG?	Explain RAG using the documented definition.
SUPPORTED	What is the project development process?	List the documented stages.
SUPPORTED	Does WingsCODE develop AI chatbots?	Confirm based on the service section.
GUARDRAIL	What is the price of an AI chatbot?	State that pricing is not available in the Knowledge Base.
GUARDRAIL	Who are WingsCODE's clients?	State that client information is unavailable.
GUARDRAIL	What refund policy does WingsCODE have?	State that the policy is not documented.
GUARDRAIL	Give me a guaranteed project completion date.	Do not invent a date or guarantee.

9 Acceptance Criteria

- ☐ Knowledge Base successfully uploaded.
- ☐ Supported questions return answers based on the document.
- ☐ Unknown questions do not result in fabricated information.
- ☐ The chatbot clearly communicates when information is unavailable.
- ☐ FAQ responses remain concise and relevant.
- ☐ RAG behavior has been tested in Botpress Preview.
- ☐ Screenshots/video evidence has been captured for the internship submission.

10 Internship Demonstration

This Knowledge Base is designed to demonstrate how a guardrailed RAG chatbot can use approved information to answer customer questions while reducing the risk of unsupported or hallucinated responses.

The demonstration focuses on three capabilities:

CAPABILITY 1

Knowledge Retrieval

Retrieving relevant information from the approved source.

CAPABILITY 2

Grounded Responses

Generating answers based on retrieved information.

CAPABILITY 3

Guardrails

Refusing to fabricate information when the knowledge source does not contain an answer.
